

### Impact of ionization compression on star formation

P. Tremblin, N. Schneider, V. Minier, P. Didelon, F. Motte, E. Audit, et al. (+ HOBYS Key Program)

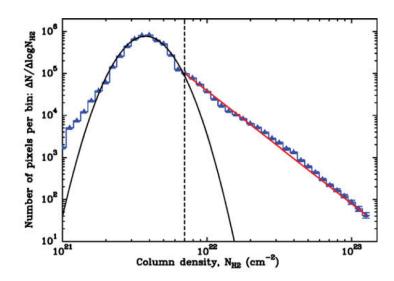

A&A 2014 564A.106T

### Age of OB associations in the Galaxy

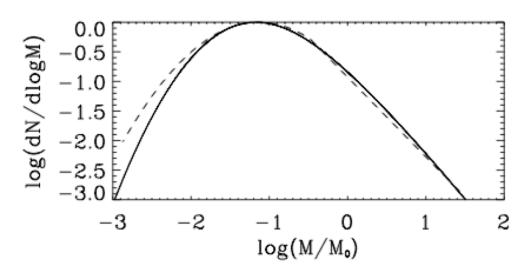

P. Tremblin, L.D. Anderson, P. Didelon, A. Raga et al. A&A 2014 568A.4T

- Compression and PDF
- Observations
- Implications

➤ Is feedback and ionization important to take it into account to understand the IMF?

Observed PDF Aquila André et al 2011

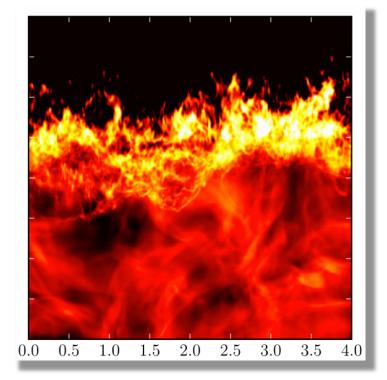

Modelled versus observed IMF Hennebelle & Chabrier 2008

#### ➤ What is ionization and compression from ionization ?

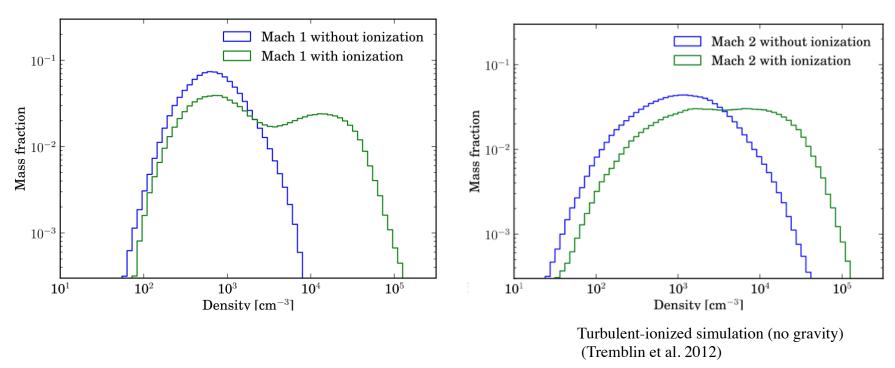

Eagle Nebula (Hill et al. 2012) HOBYS

Turbulent-ionized simulation (Tremblin et al. 2012) HERACLES code

#### ➤ How do we see the compression from ionization ?

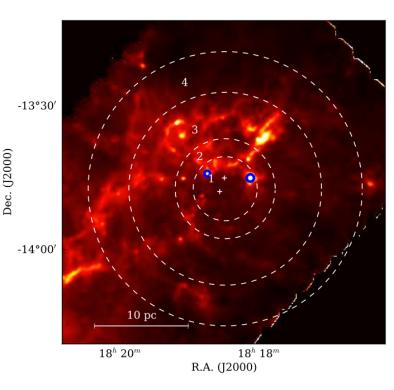

Double-peaked or enlarged PDF of the gas

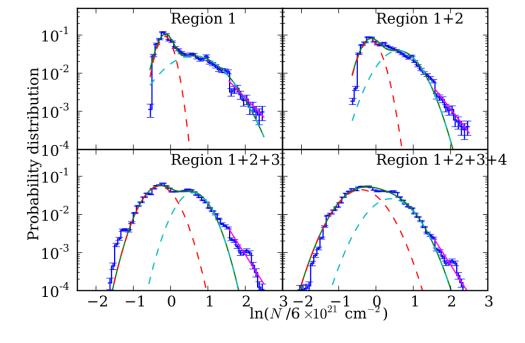

- ➤ What is the shape of the second component ?
  - ➤ If the turbulence is important in the compressed layer: lognormal shifted at higher densities by the square of the Mach number of the driven shock
  - ➤ If the turbulence is low in the compressed layer: it is homogeneous and you expect a power-law profile in the PDF (similar to the power-law in a PDF of a spherical collapsing clump)

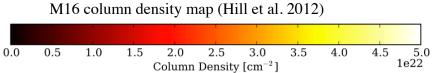

Unperturbed turbulent cloud	Compressed layer	Influence of gravity
Lognormal at low column densities	Lognormal (turbulent) or Power-law (homogeneous)	Power-law at highest column densities

Implications

#### ➤ Do we see it in observations? Herschel column densities

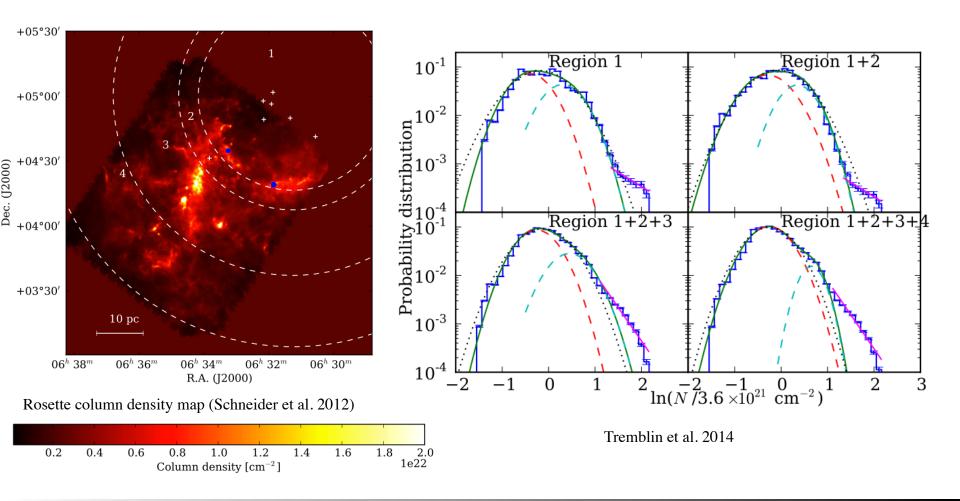

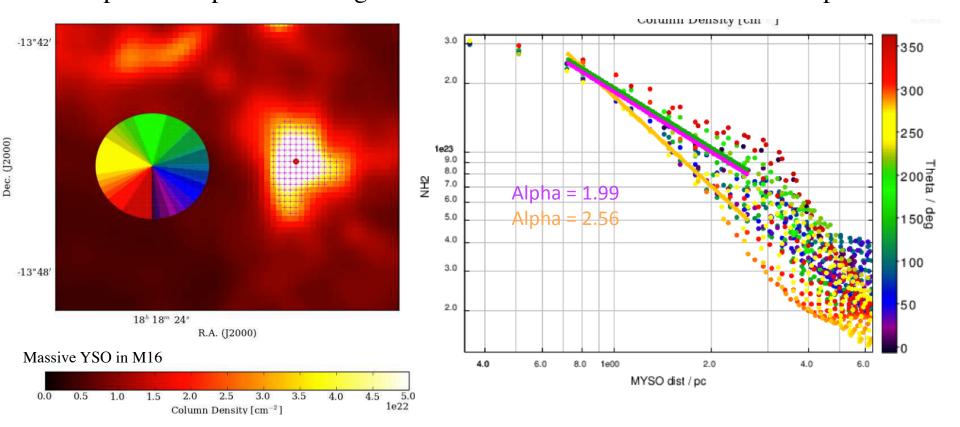

Tremblin et al. 2014

Is a two-lognormal fit better than a single one for enlarged distribution?

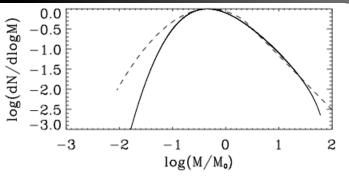

# ➤ Also small scale compression! Steeper radial profile: distinguish between forced-fall and free-fall collapse

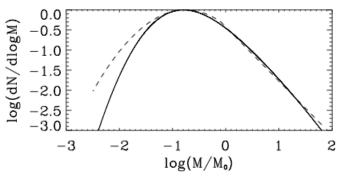

See also Russeil et al. 2013

- o Implications

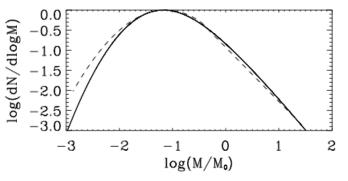

Mach 6

➤ Important for the understanding of star formation and the IMF?

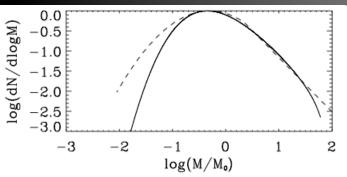

Mach 12

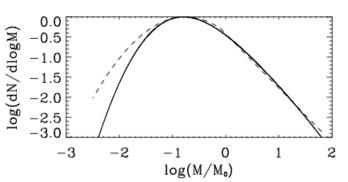

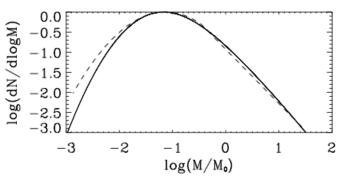

Mach 25

Hennebelle & Chabrier 2008

- Compression and PDF
- Observations
- o Implications

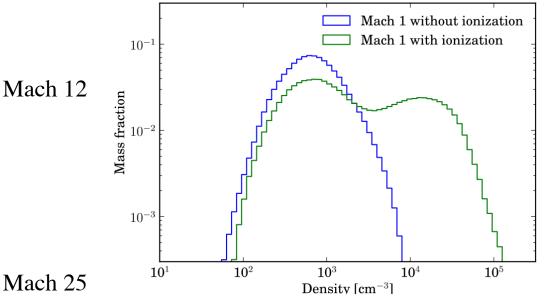

Hennebelle & Chabrier 2008

Mach 6

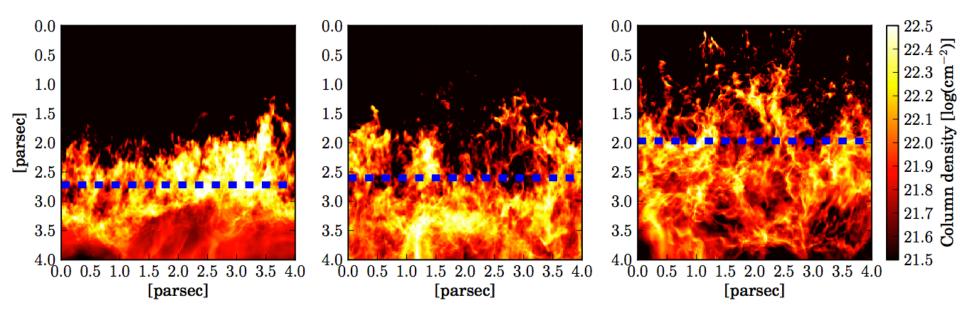

Important for the understanding of star formation and the IMF?

Mach 25

> Feedback compression can enlarge while keeping a realistic **PDF** turbulent level for the cloud

The development of the Hii region is slowed down by the turbulence

## ➤ Dating of OB associations from their associated Hii regions

Dynamics of the ionization front (Raga et al 2012):

$$\frac{1}{c_{II}}\frac{dr}{dt} = \left(\frac{r_s}{r}\right)^{\beta} - \frac{c_0^2}{c_{II}^2} \left(\frac{r}{r_s}\right)^{\beta}$$

$$r_s = (3S_*/4\pi n_0^2 \alpha)^{1/3}$$

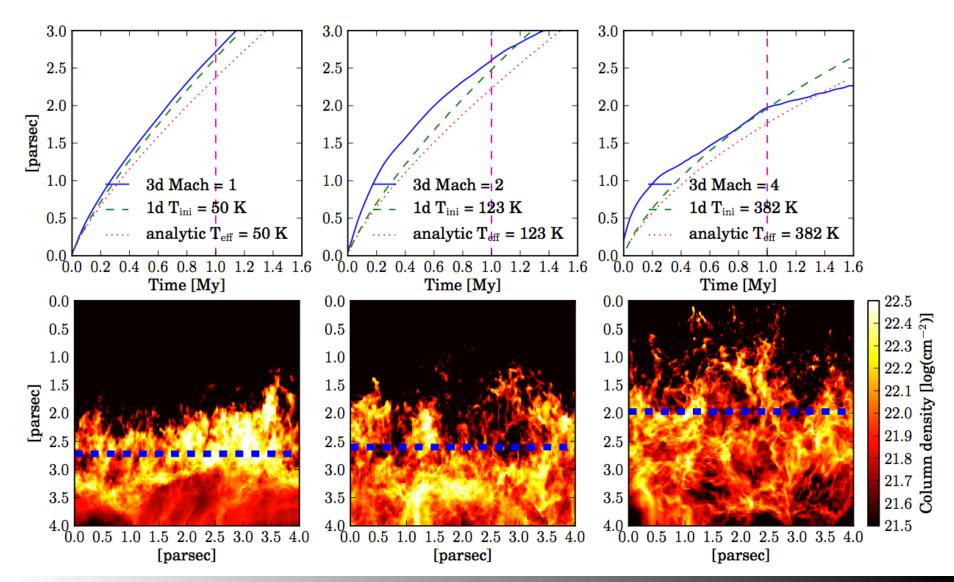

$$c_{II}t/r_s = 4/7 \times ((r/r_s)^{7/4} - 1)$$

$$P_{II} = n_0(r_s/r)^{3/2} k_b T_{II}$$

Raga et al 2012, Tremblin et al 2014

$$c_{II}t/r_s = f(r/r_s, c_0^2/c_{II}^2) - f(1, c_0^2/c_{II}^2)$$
$$r_{eq} = r_s(c_{II}/c_0)^{4/3}$$

$$\triangleright P_{II} > P_0$$

GESF P. Tremblin, 12/09/14

## ➤ Dating of OB associations from their associated Hii regions

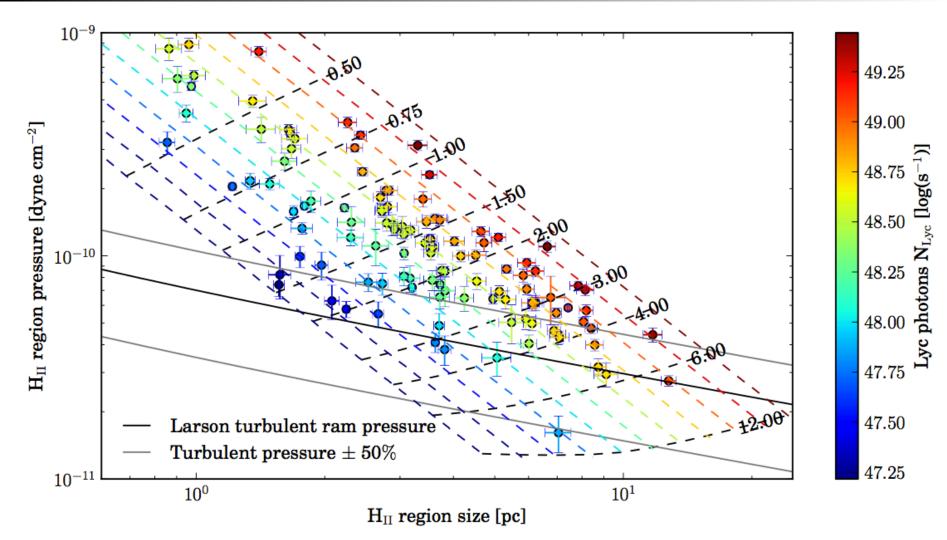

➤ 1D generic spherical models with HERACLES in Larson's law "profiles":

$$\langle \sigma \rangle = 1.1 \text{km/s} \left(\frac{r}{\text{pc}}\right)^{0.38}$$
  
 $\langle n \rangle = 3400 \text{cm}^{-3} \left(\frac{r}{\text{pc}}\right)^{-1.1}$ 

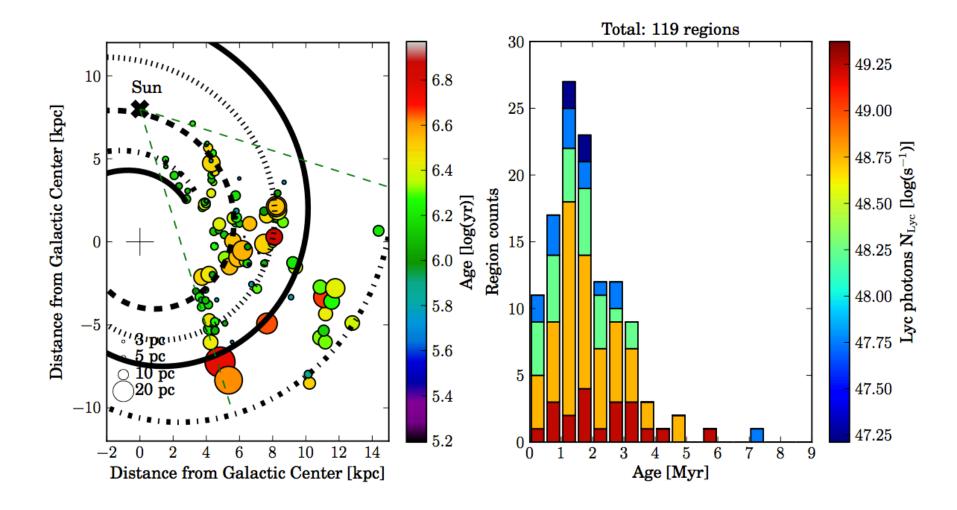

$$P_{\text{turb}} \approx \langle \rho \rangle (c_0^2 + \langle \sigma \rangle^2 / 3)$$

These simulations can be used to get an estimation of the age of the OB association:

Cloud (D)	Radius	$S_{\nu}(\nu)$	Phot. Age	Dyn. Age
[kpc]	[pc]	[Jy](GHz)	[Myr]	[Myr]
Rosette (1.6 <sup>a</sup> )	$18.7 \pm 1.2^b$	$350(4.75)^b$	≤ 5 <sup>c</sup>	5.0±0.4
$M16 (1.75^d)$	$7.2 \pm 0.7^{e}$	$117(5)^{e}$	$2-3^{f}$	$1.9 \pm 0.2$
RCW79 (4.3g)	$7.1 \pm 0.3^h$	$19.5(0.84)^h$	$2-2.5^{i}$	$2.2\pm0.1$
RCW36 $(0.7^{j})$	$1.1 \pm 0.07^{e}$	$30(5)^{e}$	$1.1 \pm 0.6^{k}$	$0.4 \pm 0.03$

Observations from the HRDS survey (Anderson et al 2011)

#### > Summary

- ➤ Ionization compresses molecular clouds and can be identified in PDFs as a second lognormal (or power-law if homogeneous compressed layer) or enlarged distribution (if the initial turbulence is high).
- Compression is also seen on radial profiles of clumps allowing to distinguish free-fall collapse and forced-fall collapse:

  steep radial profile r<sup>- alpha</sup> with alpha > 2 (around 2.5)
- While the bubble expands and halt star formation in the ionized regions it forms a second generation of stars in a compressed layer. This second generation could be of importance to get a correct IMF with realistic Mach numbers in gravo-turbulent theories.
